

This application note describes the supported PMBus™ Digital Communications supported command list for the **D1U54P-W-2000-12-HxxC-xx** series power supplies.

### PMBus™ implementaion General Notes

- Complies with PMBus™ Power Systems Management Protocol Part 1 – General Requirements Rev 1.2 and Power System Mgt Protocol Specification – Part II , Revision 1.2. Refer to these documents for additional details.
- PEC is enabled; Ensure system/host PEC enabled to avoid registering CML errors when issuing write commands.
- Linear data formatting is used for all passed parameters.
- Block reads (where the loose byte received denotes the remaining byte to be clocked out) are not supported on this product series.
- A minimum of 300µs delay between transactions (between the STOP of one command and the START of the next command) is required.
- 400KHz I<sup>2</sup>C communications is supported for the PMBus™ interface.
- The PMBus™ slave controller does “clock stretch” on ACK or NAK.
- “Page” is supported, generally, page “0”contains main output parameters and page “1” contains the standby output parameters.

### Device Details

| Power Supply Controllers  |                          |         |   |
|---------------------------|--------------------------|---------|---|
| Vendor                    | MFG Part Number          | Package | Description   |
| Microchip Technology Inc. | DSPIC33FJ64GS606T-50I/PT | TQFP64  | (Secondary) IC Dig SMT Microcontroller PIC33 TQFP64 64k 9kB 50MHz |
| Microchip Technology Inc. | DSPIC33FJ16GS504T-50I/PT | TQFP44  | (Primary) IC Dig SMT Controller PWM Industrial PIC33 TQFP44 40MHz |

| Power Supply External EEPROM |                 |         |  |
|------------------------------|-----------------|---------|--|
| Vendor                       | MFG Part Number | Package | Description  |
| Microchip Technology Inc.    | 24AA024T-I/MS   | MSOP8   | IC Dig SMT EEPROM CMOS Serial I <sup>2</sup> C AT24CXX MSOP8 2kB |

### Device Addressing Methods

There are two methods whereby the three lower order address bits of the seven bit address structure of the internal addressable devices can be assigned (for the secondary microcontroller and the EEPROM device A0, A1 & A2; see the PMBus™ standard). These are as follows:

1. Using the ADDR signal pin of the power supply in digital mode by either:
    - a. Un-terminating (leaving open circuit); this will set a default setting of “111” for the last three addressable bits (A0, A1 & A2) of the seven bit address byte, resulting in PSU/EEPROM addresses of BEH & AEh respectively.
    - b. Terminating the pin to RTN/ground (Pin numbers A2/B2); this method will set a default address of “000” for the last three addressable bits (A0, A1 & A2) of the address byte, resulting in PSU/EEPROM addresses of B0h & A0h respectively.
  2. Using the ADDR signal pin in analogue mode by connection of an external resistance to RTN/ground (pin numbers A2/B2).
- For the possible external resistance values this will result in the address combinations listed:

| HEX Address Combinations by Analogue Method; ADDR External Resistance Values |  |  |
|--|--|--|
| ADDR External Resistance to<br>RTN/Ground<br>(kΩ; ±5% Tolerance)             | Power Module Secondary<br>Main Controller (Serial Slave<br>Address)* | Power Module<br>EEPROM (Serial Slave Address)* |
| 0.82   | 0xB0   | 0xA0   |
| 2.7  | 0xB2   | 0xA2   |
| 5.6  | 0xB4   | 0xA4   |
| 8.2  | 0xB6   | 0xA6   |
| 15   | 0xB8   | 0xA8   |
| 27   | 0xBA   | 0xAA   |
| 56   | 0xBC   | 0xAC   |
| 180  | 0xBE   | 0xAE   |

\*The D1U54x-x-2000-12-HxxC-xxx uses 7-bit left shifted” device addressing; the EEPROM addressing follows a similar convention (commences at base address 0xA0); the lowest order bit of the address is the Read/Write bit. It is assumed that the Read Write bit is set to logic “0” (for addresses shown in the table above).

## PMBus™ Command List

| Command Code (Hex) | Command Name         | Read / Write                          | Page | Format    | # of Bytes | Bit # | Bit Name        | Definition   | Supported? |
|--------------------|----------------------|---------------------------------------|------|-----------|------------|-------|-----------------|--|------------|
| 00                 | PAGE                 | R/W                                   | All  |           | 1          |       |                 | Command to provide ability to configure, control & monitor multiple outputs and other parameters such as thermal sensors   | YES        |
| 01                 | <u>OPERATION</u>     | R/W                                   | All  | Bit Flags | 1          | 5:0   |                 | Set output margin high/low voltages  | NO         |
|                    |                      |                                       |      |           |            | 7:6   |                 | Turn the unit on/off in conjunction with digital input from PSON_H   | YES        |
| 02                 | <u>ON_OFF_CONFIG</u> | Send                                  | All  | Bit Flags | 1          | 0     | ON_OFF_DELAY    | Set when Turn off immediately (default) / 0 = Use delay @ turn-off   | YES        |
|                    |                      |                                       |      |           |            | 1     | ON_OFF_POLARITY | Set when Power on processing is active high (default)  | YES        |
|                    |                      |                                       |      |           |            | 2     | USE_CONTROL     | Set when Use CONTROL pin for on/off power processing (default)   | YES        |
|                    |                      |                                       |      |           |            | 3     | USE_OPERATION   | Set when Use OPERATION command for on/off power processing (default)   | YES        |
|                    |                      |                                       |      |           |            | 4     | USE_CNTL_AND_OP | Set when Use both CONTROL pin & OPERATION command (default)  | YES        |
|                    |                      |                                       |      |           |            | 5     | RESERVED        |  | NO         |
|                    |                      |                                       |      |           |            | 6     | RESERVED        |  | NO         |
|                    |                      |                                       |      |           |            | 7     | RESERVED        |  | NO         |
| 03                 | CLEAR_FAULTS         | W                                     | All  |           | 0          |       |                 | Write only command clears all faults that have been set in all the STATUS_XXXX registers simultaneously  | YES        |
| 04                 | PHASE                | R/W                                   | All  |           | 1          |       |                 | Command to provide the ability to configure, control, and monitor multiple phases on one PMBus unit.   | NO         |
| 05                 | PAGE_PLUS_WRITE      | Block Write                           | All  | Variable  |            |       |                 | Command used to set the page within a device, send a command, and send the data for the command in one packet  | YES        |
| 06                 | PAGE_PLUS_READ       | Block Write / Block Read Process Call | All  | Variable  |            |       |                 | Command used to set the page within a device, send a command, and read the data returned by the command in one packet  | YES        |
| 10                 | WRITE_PROTECT        | R/W                                   | All  |           | 1          |       |                 | Command to provide ability to configure, control & monitor multiple outputs; <a href="#">Write 0h to allow write to all supported commands</a>                     | YES        |
| 11                 | STORE_DEFAULT_ALL    | Send                                  | All  |           | 0          |       |                 | Command instructs PMBus device to copy contents of Operating Memory to matching NVM  | NO         |
| 12                 | RESTORE_DEFAULT_ALL  | Send                                  | All  |           | 0          |       |                 | Command instructs PMBus device to copy contents of NVM to matching Operating Memory  | NO         |
| 13                 | STORE_DEFAULT_CODE   | W                                     | All  |           | 1          |       |                 | Command instructs the PMBus device to copy the parameter whose Command Code matches value in the data byte, from Operating Memory to matching NVM                  | NO         |
| 14                 | RESTORE_DEFAULT_CODE | W                                     | All  |           | 1          |       |                 | Command instructs the PMBus device to copy the parameter whose Command Code matches value in the data byte, from NVM to matching Operating Memory                  | NO         |
| 15                 | STORE_USER_ALL       | Send                                  | All  |           | 0          |       |                 | Command instructs the PMBus device to copy the entire contents of Operating Memory to matching NVM   | NO         |
| 16                 | RESTORE_USER_ALL     | Send                                  | All  |           | 0          |       |                 | Command instructs the PMBus device to copy the entire contents of NVM to matching Operating Memory   | NO         |
| 17                 | STORE_USER_CODE      | W                                     | All  |           | 1          |       |                 | Command instructs the PMBus device to copy the parameter whose Command Code matches value in the data byte from Operating Memory to matching NVM User Store memory | NO         |
| 18                 | RESTORE_USER_CODE    | W                                     | All  |           | 1          |       |                 | Command instructs the PMBus device to copy the parameter whose Command Code matches value in the data byte from NVM to matching Operating Memory Store memory      | NO         |
| 19                 | CAPABILITY           | R                                     | All  | Bit Flags | 1          | 0:3   | RESERVED        |  | NO         |
|                    |                      |                                       |      |           |            | 4     | SMBALERT_L      | Set when device has SMBALERT_L pin which supports the SMBus Alert Response protocol  | YES        |
|                    |                      |                                       |      |           |            | 6:5   | MAX_BUS_SPEED   | 01 = Max supported bus speed = 400kHz; 00 Max supported bus speed = 100kHz   | NO         |
|                    |                      |                                       |      |           |            | 7     | PEC             | Set when packet error checking is supported  | YES        |

No SMBALERT support | 4. Direct Data format |

 = Default

## PMBus CONFIGURATION BITS

| Parameter   | Bit#  | Bit | Function   |         |
|-------------|-------|-----|--|---------|
| Data Format | Bit 0 | 1   | Direct Data Format   |         |
|             |       | 0   | Linear Data Format   | Default |
| SMBALERT    | Bit 1 | 1   | PS does not have SMBALERT pin or does not support SMBus alert protocol |         |
|             |       | 0   | PS does have SMBALERT pin and supports SMBus alert protocol            | Default |
| Bus Speed   | Bit 2 | 1   | Maximum supported bus speed = 400kHz                                   | Default |
|             |       | 0   | Maximum supported bus speed = 100kHz                                   |         |
| PEC support | Bit 3 | 1   | Packed error checking supported  | Default |
|             |       | 0   | Packed error checking not supported                                    |         |

## RETURNED RESULTS : LED CONTROL

Command Code EFh

| Bit # / Bit Description |          |          |          |          |                |                |                | Valid Values |     | Read / Write | LED Status & Control      |
|-------------------------|----------|----------|----------|----------|----------------|----------------|----------------|--------------|-----|--------------|---------------------------|
| 7                       | 6        | 5        | 4        | 3        | 2              | 1              | 0              | Dec          | Hex |              |                           |
| CONTROL Bit             | reserved | reserved | reserved | reserved | LED Mode Bit 2 | LED Mode Bit 1 | LED Mode Bit 0 |              |     |              |                           |
| 0                       | 0        | 0        | 0        | 0        | 0              | 0              | 0              | 0            | 0   | Read         | Auto - LED off            |
| 0                       | 0        | 0        | 0        | 0        | 0              | 0              | 1              | 1            | 1   | Read         | Auto - LED solid green    |
| 0                       | 0        | 0        | 0        | 0        | 0              | 1              | 0              | 2            | 2   | Read         | Auto - LED blinking green |

## Cold Redundancy ("CR") Configuration Bytes:

Note - first requires Pin configuration [CMD\\_EA](#) to change signal function from INPUT\_OK to RAPID\_ON.  
(Refer to application note "ACAN-80" should additional detail be required)

2 modes of "CR" operation:

## 1) Automatic Mode CR (INTEL CRPS):

- 0x0h = conventional redundancy
- 0x1h = Master & Active PSU
- 0x2h = Cold\_redundant\_Level\_1
- 0x3h = Cold\_redundant\_Level\_2
- 0x4h = Cold\_redundant\_Level\_3

## 2) Manual

Roll Names:

CONVENTIONAL REDUNDANCY: (BYTE 0x0h) = DEFAULT SETTING

COLD\_REDUNDANCY\_FORCED\_ACTIVE: (byte 0x55h) At least one (1) PSU must be assigned this roll, aka "Always On" (subsequent

PSUs assigned this same roll will be known as "ACTIVE &amp; SLAVE" and the first PSU Assigned the roll of "55" provides the bus pull-up)

COLD\_REDUNDANCY\_FORCED\_STANDBY\_X: (byte 0xEh) System makes the PSU output on/off decision and write either "55h" or "Eh" as system requires. Up to 8 PSUs can be controlled in this mode.

NOTE: If the MASTER & ACTIVE PSU to a is written to mode "0x0" by host/system, the CR bus will be forced low and all connected PSUs will end CR mode and immediately share conventionally, while COLD\_STANDBY\_x assigned PSUs simply enter conventional current share and do not pull down the CR bus.

## Linear Data Format

[\(return to front page; return to Manual Fan Control\)](#)

Telemetry via sensor readings is expressed in Linear format, defined by PMBus Power System Mgt Protocol Specification – Part II – Revision 1.2 (summarized below)  
Output Voltage readings are also expressed in linear format, **VOUT\_MODE** format

The Relationship between Y, N and the “real world” value is:

$$X = Y \cdot 2^N$$

Where, as described above:

X is the “real world” value;

Y is an 11 bit, two's compliment integer; and

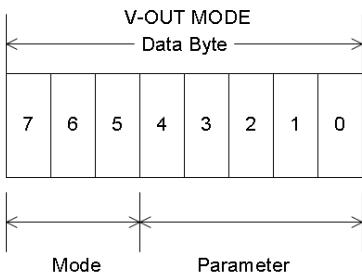

N is a 5 bit, two's compliment integer.

## Command Code 20h (V-OUT MODE) PROTOCOL and Returned results:

Link back to [CMD\\_20 list](#)

Output voltage reading telemetry is expressed in V-OUT MODE Linear format. The results can be converted to “real world” voltage reading by the following two steps. Refer to PMBus Power System Mgt Protocol Specification – Part II – Revision 1.2 for additional details.

- 1) CMD\_20 (V-OUT MODE) defines which of the three formats (LINEAR, VID OR DIRECT) is used. For all output voltage commands for this product, LINEAR MODE is used, returning “000h” for bits 5,6,7:

CMD\_20h Reading results for this series:

|                            |            |  |                              |              |       | Bit 4 | 1     |
|                            |            |  |                              |              |       | Bit 3 | 1     |
|                            |            |  |                              |              |       | Bit 2 | 0     |
|                            |            |  |                              |              |       | Bit 1 | 1     |
|                            |            |  |                              |              |       | Bit 0 | 0     |

- 2) The Command Bytes, or mantissa can then be used to calculate real world values for the output voltage commands and parameters:

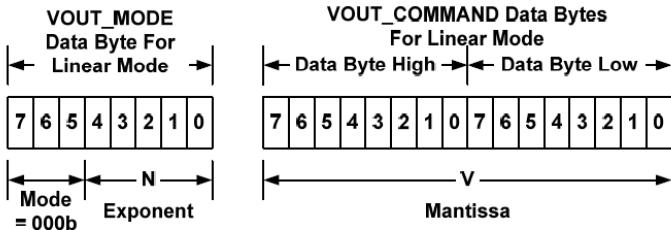

Figure 6. Linear Format Data Bytes

The Mode bits are set to 000b.

The Voltage, in volts, is calculated from the equation:

$$Voltage = V \cdot 2^N$$

Where:

Voltage is the parameter of interest in volts;

V is a 16 bit unsigned binary integer; and

N is a 5 bit two's complement binary integer.

RETURNED RESULTS :Command Code 3Bh (FAN\_COMMAND\_1) Link Back to Commands List: [CMD\\_3B](#)

Manual fan speed control via PMBus™ is a linear data mode two byte command, speed expressed as fan duty cycle. This table below contains the manual fan speed command data in 1% increments, for illustration purposes.

The power supply automatically cancels manual fan sped control and enters automatic fan speed control by any of the following conditions or methods:

- 1) Writing the command "03h"(CLEAR\_FAULTS).
- 2) Any overtemperature fault or warning (manual fan speed control mode can be resumed after the faults and warnings have ended)
- 3) Recycling of AC input voltage
- 4) Toggling PS\_ON signal
- 5) Issuing a fan command that is outside the normal maximum limits, i.e., writing a fan speed of 110% duty cycle.
